

Research Data Management workshop

@Harvard Libraries

PURDUE
UNIVERSITY
LIBRARIES

HARVARD
LIBRARY

Purdue Libraries
Harvard Libraries

June 18, 2015

The purpose of this workshop is to explore data management, identify activities that can help integrate library services into the research lifecycle, and demonstrate that data management and curation is about building relationships and engaging stakeholders at all levels across the university.

Overview of Data Management

Taking a Look at the Landscape

- Opening: Sarah E. Thomas, Vice President for the Harvard Library, Harvard University
- Remarks: James L. Mullins, Dean of Libraries, Purdue University
- Paul Bracke: Reflections from past day
- Sarah Demb: Local context at Harvard

Overview of Data Management

Taking a Look at the Landscape

- Paul Bracke: Reflections from past day

- Line Pouchard: Overview of lifecycles: research, data, and curation
- Amy Barton: A model for collaboration
- Chris Erdmann: on education & scale, and using tools
- Scott Brandt: Building relationships and crafting messages

- Line Pouchard, PhD
- Scott Brandt

- Purdue Libraries,
Research Data

• 06/18/2015

**HARVARD-
PURDUE DATA
MANAGEMENT
WORKSHOP**

**Interconnecting Lifecycles –
Research, Data, Curation**

DEFINITIONS OF DATA CURATION

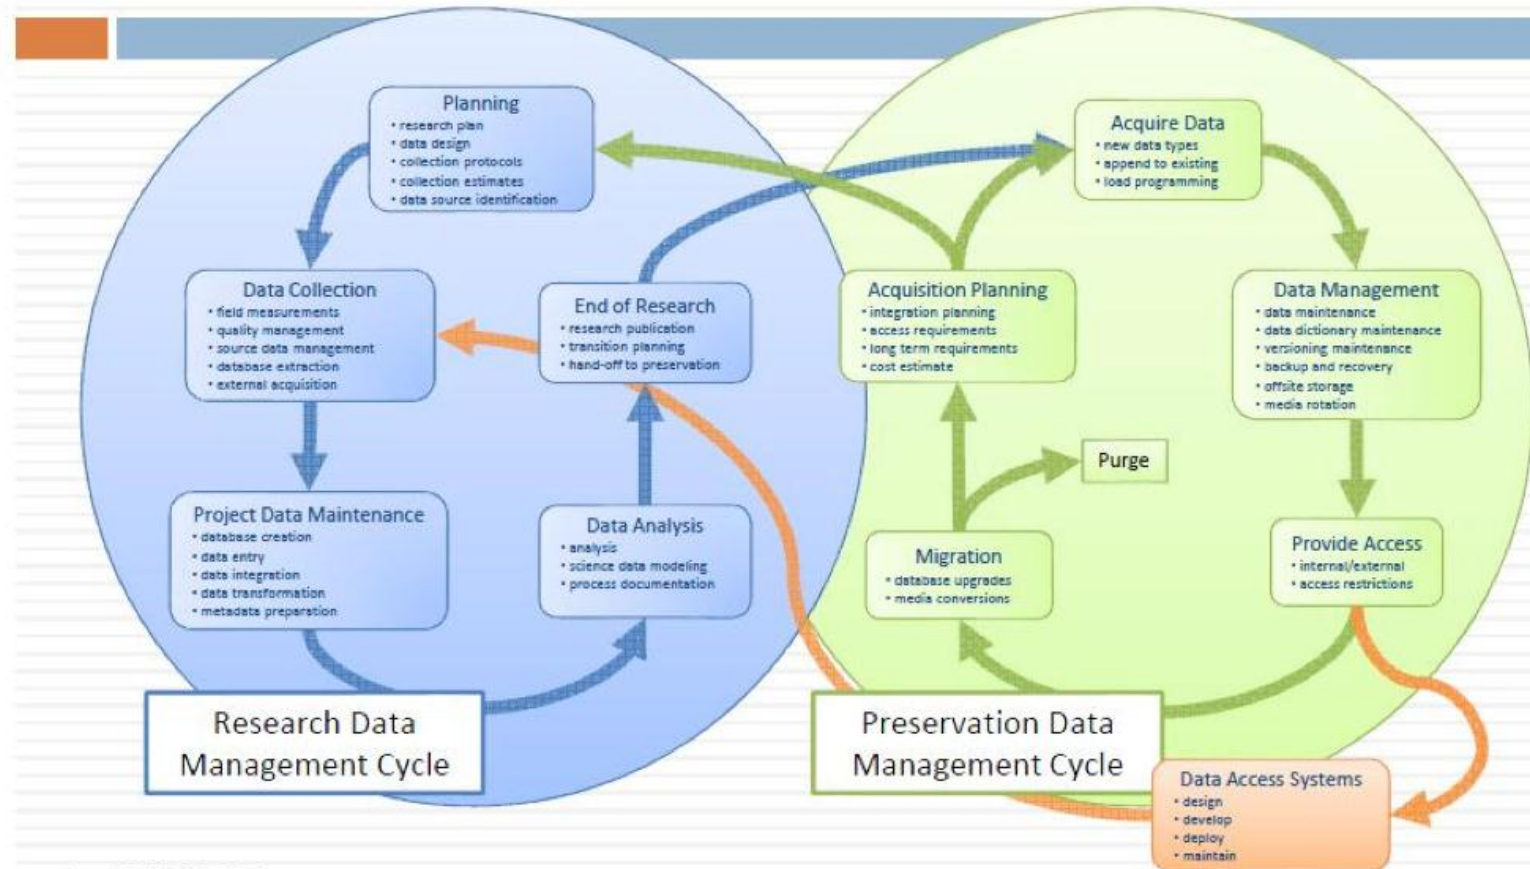

- **Data curation** is a term used to indicate management activities required to maintain research data long-term such that it is available for reuse and preservation (Wikipedia)
- The active and ongoing management of data through its life cycle of interest and usefulness to scholarship, science, and education. Data curation activities enable data discovery and retrieval, maintain its quality, add value, and provide for reuse over time, and this new field includes authentication, archiving, management, preservation, retrieval, and representation
- Source: Specialization in data curation, Graduate School of Library and Information Science, University of Illinois (https://www.lis.illinois.edu/academics/degrees/specializations/data_curation)

DATA LIFE CYCLES

- There are many life cycle examples:
 - research life cycles, data life cycles, curation & preservation life cycles
- In our practice, we use them both as metaphor and schematic
- Data life cycles help determine our tasks and roles at every step of the research project
- Sometimes it is useful to show them to a researcher, but not always.

EXAMPLE OF LIFE CYCLES WITH THREE PHASES

Research and Preservation

Research Life Cycle

- <http://data.library.virginia.edu/data-management/>

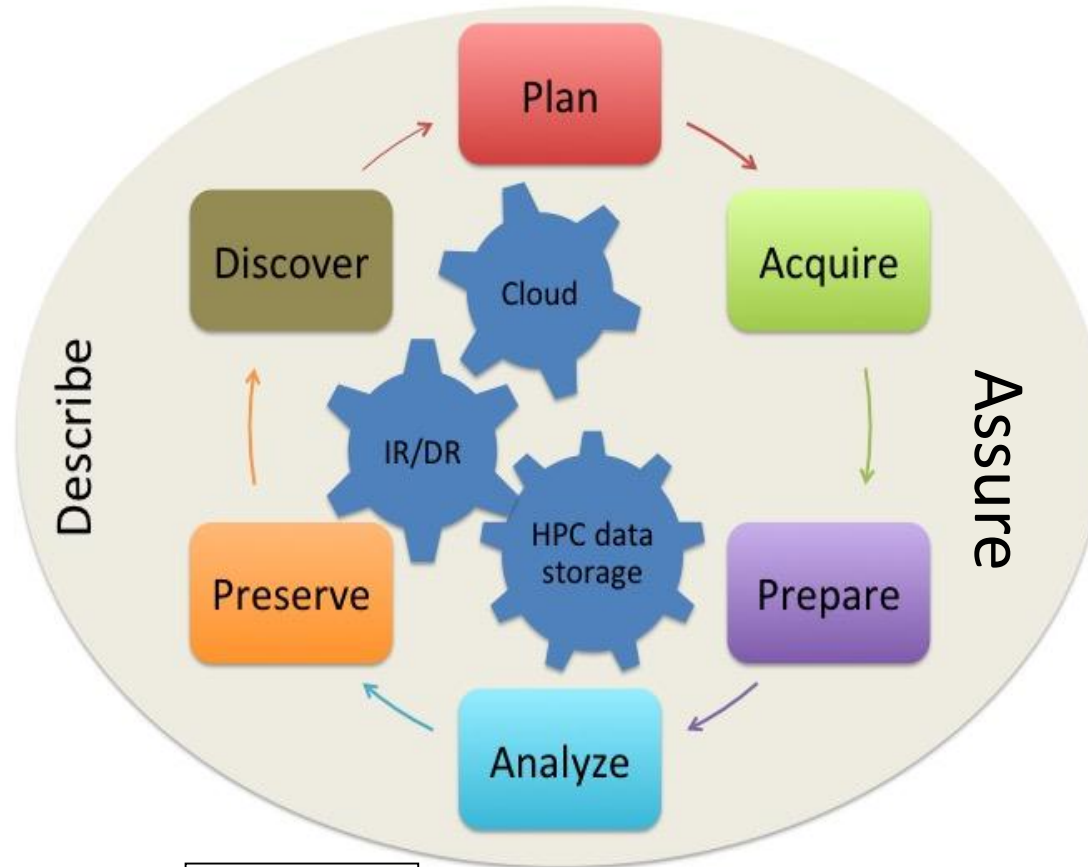

ROLES AROUND DATA

- Data reference questions (where to find standards)
- Reviewing/revising DMPs (providing input/suggestions)
- Data management planning (identifying metadata along lifecycle)
- Data consultation (may lead to collaborations/grants)
- Using repository (local, disciplinary)
- Promoting data DOIs
- Data information literacy (graduate students/lab)
- Finding and using data (e.g., using r3data.org)
- Developing tools (e.g., Data Curation Profiles)
- Developing data resources (LibGuides, tutorials)
- Developing local data collections
- Promoting open access

DATA LIFECYCLE ACTIVITIES

Description of Data

Attribution/citation

Data Formats

Standards for Interoperability

Intellectual Property Rights

Description for Discovery

Provenance for Preservation

Metadata for Organization

Documentation of Methodology

Software

Sharing & Access Policies

QUESTIONS INFORMING CURATION ACTIVITIES

	Plan	Acquire	Prepare
Volume	What is an estimate of volume & growth rate?	What is the most suited storage (databases, NoSQL, cloud)?	How do we prepare datasets for analysis? (remove blanks, duplicates, splitting columns, adding/removing headers)?
Variety	Are the data sensitive? What provisions are made to accommodate sensitive data?	What are the data formats and steps needed to integrate them?	What transformations are needed to aggregate data? Do we need to create a pipeline?
Velocity	Is bandwidth sufficient to accommodate input rates?	Will datasets be aggregated into series? Will metadata apply to individual datasets or to series?	What type of naming format is needed to keep track of incoming and derived datasets?
Veracity	What are the data sources? What allows us to trust them?	Who collects the data? Do they have the tools and skills to ensure continuity?	Are the wrangling steps sufficiently documented to foster trust in the analysis?

QUESTIONS INFORMING CURATION ACTIVITIES

	Analyse	Preserve	Discover
Volume	Are adequate compute power and analysis methods available?	Should raw data be preserved? What storage space is needed in the long-term?	What part of the data (derived, raw, software code) will be made accessible to searches?
Variety	Are the various analytical methods compatible with the different datasets?	Are there different legal considerations for each data source? Are there conflicts with privacy and confidentiality?	What search methods best suit this data – keyword-based, geo-spatial searches, metadata-based, semantic searches?
Velocity	At what time point does the analytical feedback need to inform decisions?	When does data become obsolete?	What degree of search latency is tolerable?
Veracity	What kind of access to scripts, software, and procedures is needed to ensure transparency and reproducibility?	What are the trade-offs if only derived products and no raw data are preserved?	Providing well-documented data in open access allows scrutiny. How is veracity supported with sensitive and private data?

COLLABORATIONS IN PROJECT

- Collaborations on multi-disciplinary proposals and projects
 - Levels of collaboration
- Developing customized Data Management Plans
- Organizing your data
- Describing your data
- Sharing your data
- Publishing your datasets
- Preserving your data
- Education on best practices

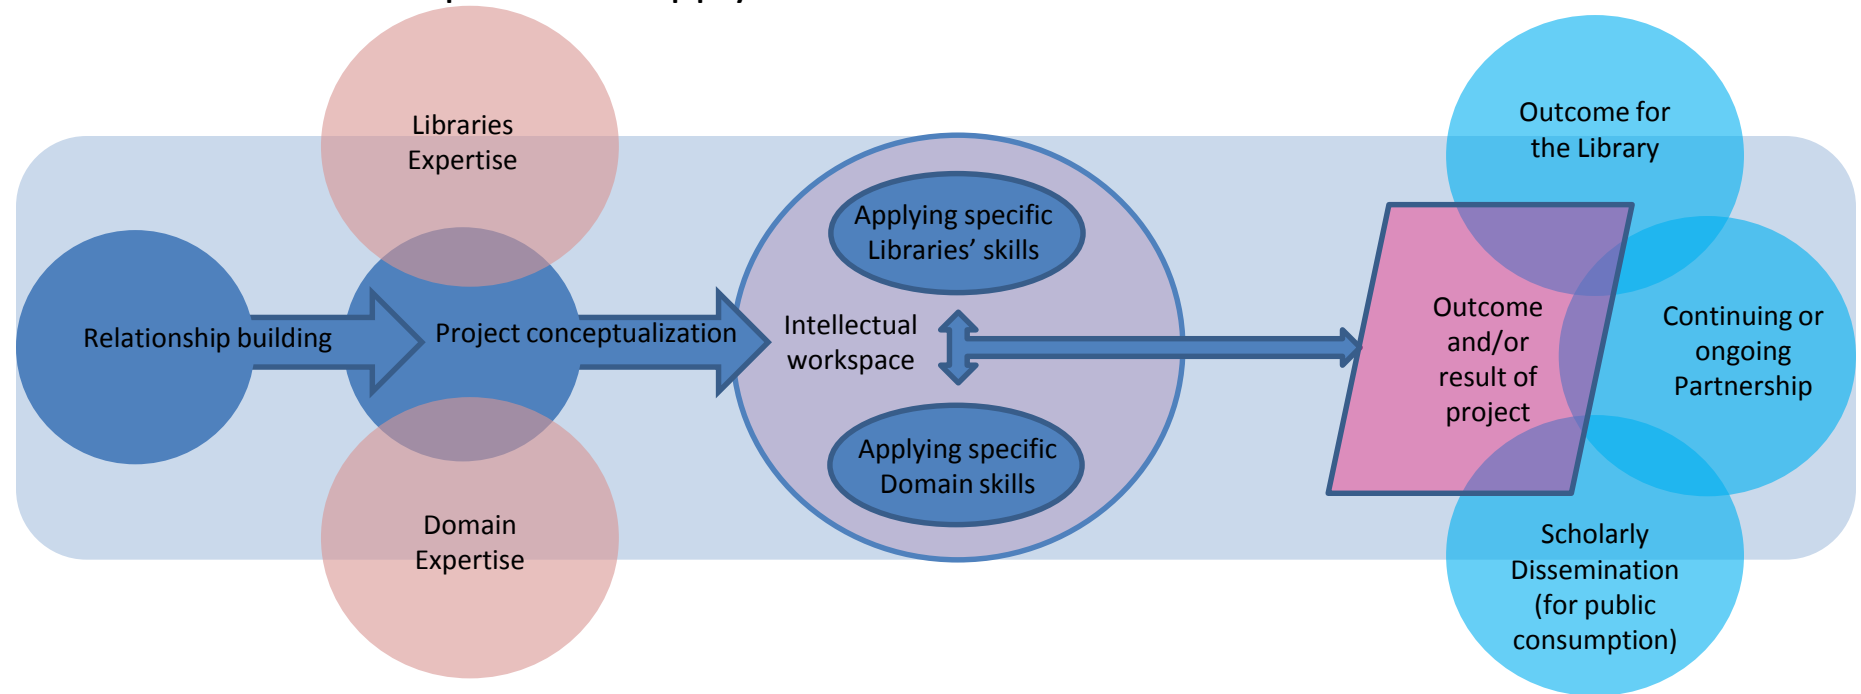

- Amy Barton: A model for collaboration

Research, data, curation lifecycles

Model for Collaboration

A Draft Conceptual Model for Libraries Expertise Conjoining with Domain Expertise to Apply Active Research to Produce Research Data

Color code:

Light blue = Research channel (throughput)

Dark blue = Process

Lavender = Domain expertise

Purple = Applied expertise in collaboration

Pink = Results of collaboration of domain expertise, library expertise, and library services...

Turquoise = Scholarship

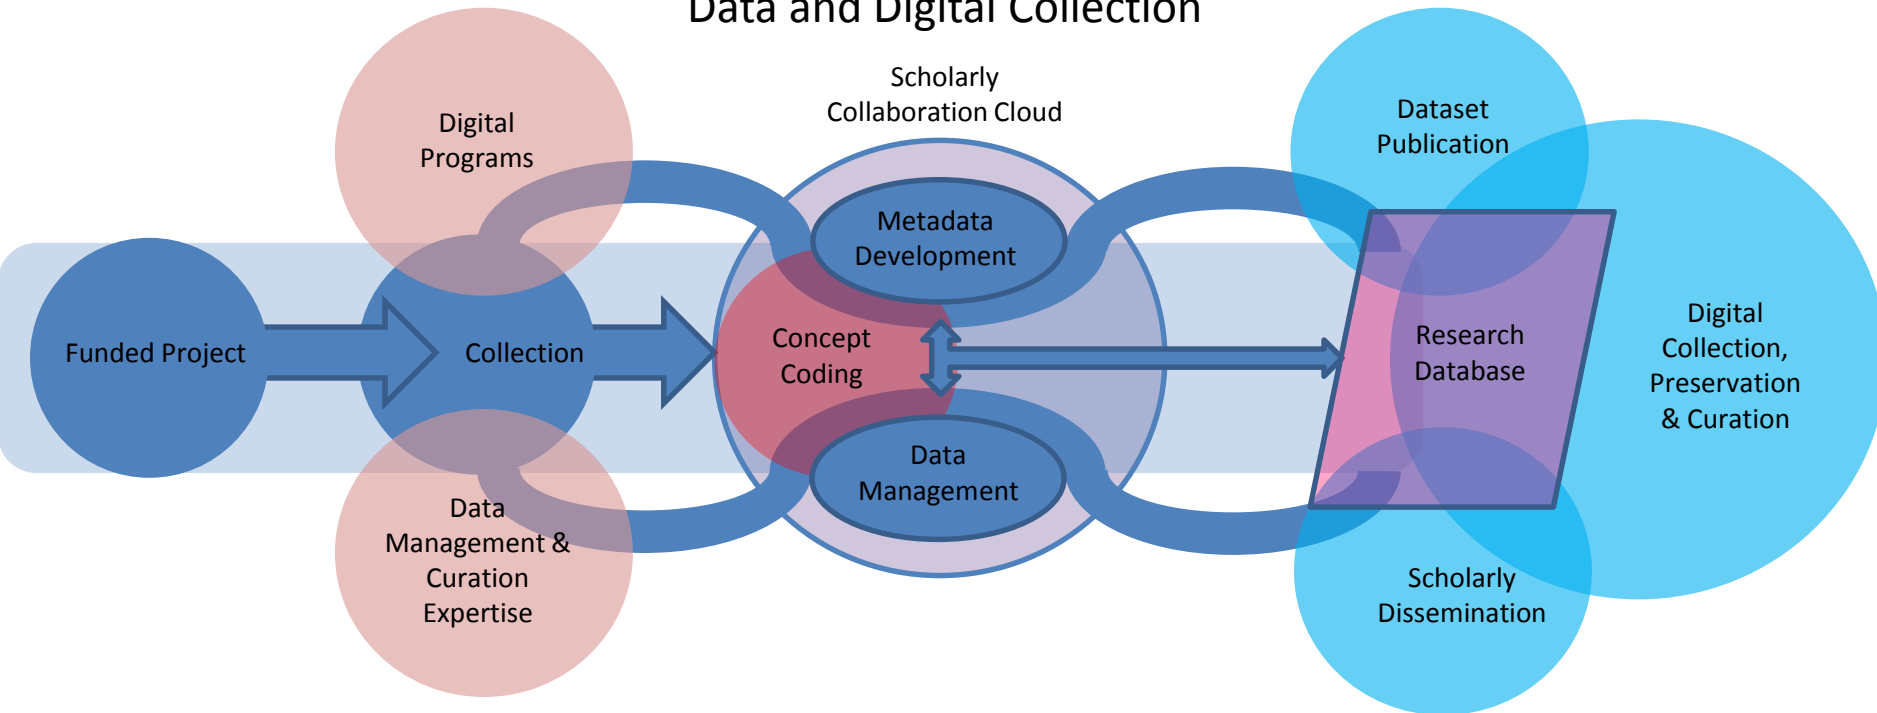

Components:

- Conceptualization
- Data collection
- Data processing
- Collaboration
- Data product
- Data curation

Research, data, curation lifecycles

Model for Collaboration: Amnesty International

A Draft Conceptual Model for Libraries Expertise/Services Conjoining with Domain Expertise to Apply Active Research to Produce Research Data and Digital Collection

Domain Expertise:

- Political Science
- Library Science
- Metadata
- Research Data

Libraries Services:

- Archives
- Digital Programs
- Libraries IT

- Chris Erdmann: Rewarding the Tool Builders

Scott Brandt: relationships and messages

Some extrapolation...

- Data are for use.
- Every researcher his or her data.
- Every data its researcher.
- Save the time of the researcher.
- The world of data is a growing organism.

with apologies to S. R. Ranganathan

[About Us](#)

Build Relationships with Stakeholders

Once you've identified your key stakeholders, it's time to begin building relationships.

Start now. Begin introducing yourself to policy makers immediately with the understanding that relationships take time to establish and build.

Be visible. Be visible in the community and at meetings. Re-introduce yourself and say hello, and let policy makers get to know you BEFORE you need them to know you (e.g. in a crisis).

Be attentive. Listen for community needs and think about whether and how the library can meet those needs.

One of the best ways to advance a relationship is to meet face to face. This can be the hardest part, but it's so important for sharing your message. And you need to meet stakeholders in person, because that is how they connect you with your library. Here's how to make that connection:

Think first. Before you set up a meeting, think about what the people you want to meet with care about. Then, try to connect your library with their interests. For example, if you are meeting with a city council representative, does that person sit on any committees that affect the library? Have they been an advocate for youth? You can provide them with information about youth in the community they may not know. You can also tell the story about how your library is essential for the youth in your community.

Find a mentor. If you've never participated in this kind of meeting with a stakeholder, ask to attend a meeting with a trusted colleague or two. You can pay attention to what they do, how they speak, and how they describe the importance of your library and its role in the community. Afterwards, ask

Research, data, curation lifecycles

Elevator Pitches:
also Takes Time...

50 conversations → 10 discussions → 1 meeting

- Read: news, websites, announcements, etc.
- Go to seminars, talks, presentations, where people hangout for coffee
 - Let people know who you are
- Email people hello, congratulations, etc.
 - See if you get a nibble
- Suggest going out for coffee...

Research, data, curation lifecycles

Building Relationships: Data interview

PURDUE
UNIVERSITY

Libraries Access. Knowledge. Success.

http://docs.lib.purdue.edu/lib_research/81/

INTRODUCTION

Librarians at Purdue University are beginning to identify the scientific datasets that are being generated by our faculty and researchers as information assets to be collected, preserved, and made accessible as a function of the library's collection development. These librarians are subject-area specialists, and many have advanced degrees in their respective disciplines in addition to a degree in library science. They have all been trained in collection management; however, much of this training was related to traditional formats such as monographs and serials and not datasets. In our experience, one of the most effective tactics for eliciting datasets for the collection is a simple librarian-researcher interview. In this poster, we share a set of ten questions that a librarian can use as a starting point for such a "data interview". It is not a comprehensive strategy but instead a practical tool to draw out information that needs to be considered in order to evaluate the suitability of a dataset for the collection and the requirements for the infrastructure and services that will be needed for data curation.

#1 What is the story of the data?

Begin the interview with an open-ended question that allows the researcher to talk freely about his or her research, scientific workflow, and community of practice. This lends some insight into the value of the dataset and how it may fit into your collection and be used, and it provides the *context* for understanding how and why the dataset was created and how it was processed and analyzed.

#2 What form and format are the data in?

What computing environments (e.g., software) are required to use the data? If the data are in proprietary structures, you may consider reformatting them into agnostic formats or ones that can be more easily *re-versioned*. Is there any existing *metadata*, either external to the data or description that could be extracted from it? Ideally the data could be described to be discoverable by researchers from another discipline.

#3 What is the expected lifespan of the dataset?

In many cases, there are distinctions in the utility of a dataset as it begins in a raw state and then is analyzed and processed into new forms and versions as a result of different steps in the research workflow. Different entities may have custody of the data and use it for different purposes at different times, affecting its *provenance*. Funding agencies may require that data be archived for a prescribed period of time or you may forecast its future value and the amount of time it should be retained. The data may be described and archived for effective *preservation* to ensure its accessibility and integrity over time.

#4 How could the data be used, reused, and repurposed?

This is a primary *selection* criterion that also impacts how the data are *accessed* and what *policies* may be needed to govern its use. As data are archived and shared, new and unintended uses for the data may increase its value. For example, a research dataset may be repurposed as a learning object.

#5 How large is the dataset, and what is its rate of growth?

It is important to quantify the size of the data for storage and network provisioning if you intend to *ingest* it into your repository. What is its physical

(bits) and logical (records) *scale*? Is the dataset static or dynamic? Ask for a sample of the data to examine.

#6 Who are the potential audiences for the data?

Information regarding potential users of the data and the users' needs is paramount. Along with potential uses for the data, this is another primary *selection* criterion. In some cases, the data may need to be embargoed or restricted to a limited group of users who are granted *permission* to access it.

#7 Who owns the data?

Establishing and maintaining the *intellectual property* represented by the data should be discussed at the earliest opportunity, and any conflicts should be resolved up-front. Many organizations have a submission policy that asks the contributor to verify that they own the data and have the right to submit it.

#8 Does the dataset include any sensitive information?

All data should be reviewed for information that violates *confidentiality*, such as identification information on human subjects. Data curation activities should be informed by institutional review board requirements.

#9 What publications or discoveries have resulted from the data?

The researchers may have a bias regarding the importance of their data. The purpose of this question is to establish an objective metric for determining the value of the data for the collection. Different metrics may be more appropriate in determining the *selection* criteria for different kinds of data and data collections.

#10 How should the data be made accessible?

There is value in making data accessible using a conventional web-based user interface, but machine-to-machine interfaces should also be evaluated. These *methods of access* will be informed by the answers to the previous questions, and this question can be asked in an open-ended manner to fill in any gaps remaining at the conclusion of the interview.

SUMMARY

Although building robust collections of datasets present several complexities and challenges to resolve, the process of looking at scientific datasets as information assets and exploring what is needed to develop and manage data collections is similar to the traditional collection development practices that have been successfully employed by librarians for decades. We offer these ten "data interview" questions as a springboard for librarians to explore data curation in greater depth and specialization.

“Conducting a Data Interview”

Michael Witt & Jake Carlson, Purdue University Libraries, West Lafayette, Indiana, USA

Research Framework

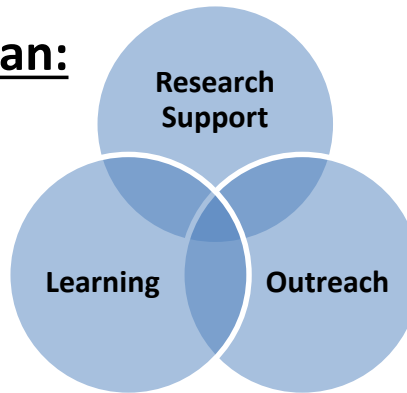

❑ Information Collection:

Interviews, project participation, consultation, feedbacks, etc.

❑ Analysis:

Interview transcripts, survey results, email feedbacks, notes -> Nvivo 10

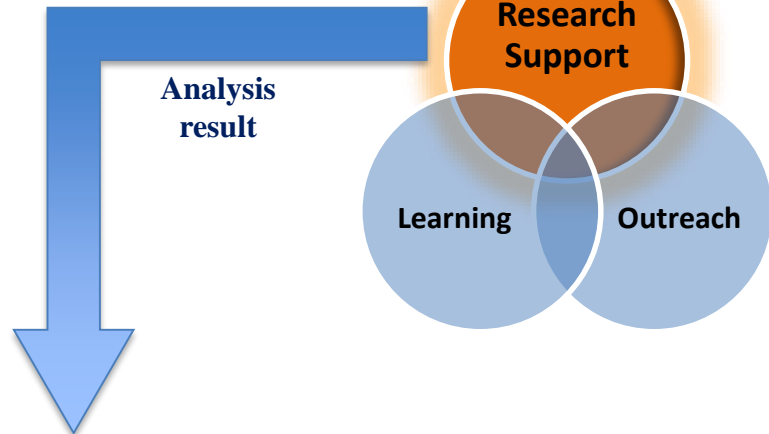

❑ Action Plan:

Results

Research Support

- Spatial Visualization**
 - Humanities
 - Educational purpose
 - Data sharing, broad impact
- Data Integration**
 - Data from different sources
 - Data between peers
 - Data from external sources
- Spatial Analysis**
 - Liberal Arts: getting started
 - STEM: advanced analysis

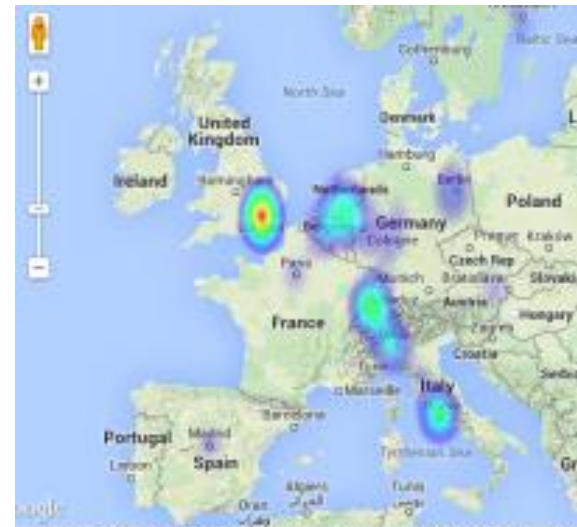

Results

Research Outcome

Geospatial Expectation (humanities):

- ❑ Spatial data integration
- ❑ Spatial visualization
 - online
 - user friendly
 - search/query function
 - scholar communication

Jackson Pollock in Western Europe 1958-1962 Cultural Diffusion

The period between 1958 and 1962 marks the highest point in the visibility of American expressionism and Jackson Pollock in Western Europe. The American artist could be seen in Europe, while *New American Painting, Jackson Pollock 1912-1956, and Jackson Pollock: Paintings, Drawings and Watercolors* from the Collection of Lee Krasner were sold from city to city.

- **Wow-How-Now**
 - Something to get attention, tell how you can help (i.e., what you do), give a current example
- **The New Elevator Pitch**
 - Conversation, emotional benefit, quantify, “close”
- **Conflict:**
 - ID a conflict (problem), escalate the conflict (say why it’s problematic), resolve the conflict (discuss ways to address the problem)

Research, data, curation lifecycles

Elevator Pitches: Wow-How-Now

- **Wow**
 - “Data management seems to be so complex.”
- **How**
 - Describe how it involves steps in a lifecycle, keeping track of what’s going on, and documenting it...
- **Now**
 - Discuss how the library knows of checklists that can be adopted by graduate students in their work.

- Conversation starter
 - “Do you think the people restoring the USS Constitution document every step of their work?”
- Emotional benefit
 - “That’s got to be hard to do. But we try to help people do that for research: document the data lifecycle.”
- Quantify
 - “We helped people write [X, many, some] document management plans last year.”
- “Close”
 - “If you know of anyone we could help, here’s my card.”

Data Management and Curation

In Conclusion

“...the difference between what the most and the least learned people know is **inexpressibly trivial** in relation to that which is unknown.”

DATA MANAGEMENT PLANS

ELEMENTS, OPTIONS, & WHERE TO GET HELP...

What is a DMP?

- Managing , disseminating and sharing research results.
- Describes
 - what data will be produced
 - how data will be standardized, organized, tagged, archived, shared, distributed, secured, preserved, etc.
 - identifies who will take responsibility for these actions.
 - Generally brief

DMP vs. dmp

www.dataone.org

Data Management Plan

Arthropod responses to grassland nutrient limitation.

1. Types of Data Produced

We will collect insects annually from the 30 experimental plots at each of the eight sites (see body of proposal for sampling details). Samples will be immediately deposited in sealable containers labeled with the date, site code (already existing), block, plot, and subsample. An associated record of any observations or notes will be entered in a field tablet computer and labeled with the same information. We will also record environmental information including temperature and general observations. Labeled samples will be transported back to the laboratory, where they will be sorted and identified using a dissecting microscope. We will identify and count the arthropods to the classification of order, with the exception of members of the order Auchenorrhynca, which will be identified to species or morphospecies. Identifications will be reviewed by multiple researchers associated with the project and verified with the assistance of Stuart McKamey of the Systematic Entomology Laboratory of the USDA Agricultural Research Service. Representatives of the identified species and morphospecies will be vouchered to the Bell Museum of Natural History at the University of Minnesota (U of M).

Abundance for each group will be recorded by hand in a laboratory notebook during sorting. These data will be transcribed into an Excel spreadsheet as each sample is completed. The spreadsheets will be stored on a controlled-access U of M server directory that is backed up offsite nightly. Files will be named according to the format *site_mmd/yyyy_plot.csv* using existing unique site codes. Lind will be responsible for the data during and after data collection until publication.

After identification, Arthropod samples from each experimental plot will be subsampled and sent to the University of St. Thomas Kay lab for stoichiometric analysis. We will receive a spreadsheet of data after processing is complete. This spreadsheet will include the insect identification (including site code, date, year, plot, and arthropod identification) and percent by mass of carbon, phosphorus and nitrogen. These files will be saved as .csv files in the previously described server directory.

Our data set will be used in combination with the existing Nutrient Network (nutnet.unm.edu) data on plant responses to nutrient manipulation. The NutNet data is currently stored and managed in a MySQL relational database housed at the Minnesota Supercomputing Institute and accessed through a secure internet connection. We will add our data and metadata to the NutNet relational database. The existing csv files will be read into temporary tables in the MySQL database, and then inserted into permanent data tables using insert query statements. The existing database schema links tables of data observations to a "plot" table describing the experimental unit. New tables will be created for each of the arthropod data types (abundance and stoichiometry) containing the unique plot identifier. Multiple tables may be necessary for efficient data storage and management; for example, an "Arthropod" table holding scientific names for use can be used to constrain the labels of abundance records to acceptable possibilities.

2. Data and Metadata Standards

The project will leverage existing metadata standards currently stored in Ecological Metadata Language (EML) format for the NutNet project. We will add additional metadata entries for the arthropod community composition and arthropod stoichiometry; field notes taken during the time of collection will be recorded. Morpho software will be used to generate the metadata file in EML. We chose EML format for our metadata since it allows integration with existing NutNet data housed in the Knowledge Network for Biocomplexity (KNB) data repository.

2 Example DMP - NutNet.
© DataONE 2011

3. Policies for Access and Sharing

After publication of manuscripts based on the data we collect, we will share our data and metadata with the NutNet community via data updates sent annually as .csv files from the existing central relational database. Other NutNet users will need to contact Lind for access to the data.

We will also submit both of our datasets (abundance and stoichiometry) to the U of M Digital Conservancy, an archive for digital preservation. Borer has access to this resource as a faculty member. This will occur within a year of publication. The data will be publicly available via the Digital Conservancy, which provides a permanent URL for digital documents.

4. Policies for Re-use, Distribution

Access to databases and associated software tools generated under the project will be available for educational, research and non-profit purposes. Such access will be provided using web-based applications, as appropriate.

Materials generated under the project will be disseminated in accordance with University/Participating institutional and NSF policies. Depending on such policies, materials may be transferred to others under the terms of a material transfer agreement.

Those that use the data (as opposed to any resulting manuscripts) should cite it as follows:

Lind, E, E Borer and A Kay. yyyy. Grassland Arthropod abundance and stoichiometry associated with nutrient manipulation. [URL]: accessed on ddmmyyyy.

This information will be described in the metadata.

Intended and foreseeable users of the data are NutNet collaborators and participants, as well as other scientists interested in arthropod-plant relationships. This data set could be used in combination with similar data sets from other NutNet sites or for meta-analysis.

5. Plans for Archiving and Preservation

We will preserve both arthropod datasets generated during this project (abundance and stoichiometry) for the long term in the Digital Conservancy at the U of M. We will include the .csv files, along with the associated metadata files. We will also submit an abstract with the datasets that describe their original context and any potentially relevant project information. Borer will be responsible for preparing data for long-term preservation and for updating contact information for investigators.

Example DMP - NutNet.

Why do I need a DMP?

- Funding agency requirements
 - part of their Data Sharing Policy
 - ensure ready availability
 - use of research data beyond life of a project.

A DMP fulfills part of a central ethical principle and the responsible conduct of research.

Basic Elements of an NSF DMP

- ✓ **Types of data**, samples, physical collections, software, curriculum materials, other materials to be produced

Basic Elements of an NSF DMP

- ✓ **Standards to be used** for data and metadata format and content (if existing standards are absent/inadequate, this should be documented with proposed solutions);

Home > Resources for digital curators > Disciplinary Metadata

In this section

- Roles

Disciplinary Metadata

While data curators, and increasingly researchers, know that good metadata is key for research data access and re-use, figuring out precisely what metadata to capture and how to capture it is a complex task. Fortunately, many academic disciplines have supported initiatives to formalise the metadata specifications the community deems to be required for data re-use. This page provides links to information about these disciplinary metadata standards, including profiles, tools to implement the standards, and use cases of data repositories currently implementing them.

For those disciplines that have not yet settled on a metadata standard, and for those repositories that work with data across disciplines, the General Research Data section links to information about broader metadata standards that have been adapted to suit the needs of research data.

Data Management Planning Support

DMP100.org
UC56UCOP.EDU

Are you writing a grant proposal? Most Federal and many private funding agencies now require a Data Management Plan as part of the proposal. **We can help with that!**

Visit us for the components of a DMP for your sponsoring agency and help you identify resources you can use in your DMP. We're happy to meet with you on-site or via video conference, and we've partnered in the development of an online data management planning tool for researchers — the DMP Tool (DataStool.org). See the [online tool](#) today.

As a UVA DMP Tool user, researchers use feedback and their UVA Computing ID to access the DMP Tool. The tool provides links to local UVA resources for guidance and help while developing your Data Management Plan.

The Data Management Consulting Group, part of the University of Virginia Libraries' Research Data Services, is available to help with Data Management Plans for all UVA researchers, whether you use the DMP Tool or not, and for those who prefer help with data management beyond just the proposal stage.

Check out the DMP Tool or email us at dmptool@virginia.edu to set up an appointment. Here's a short slide deck from our Data Management workshop on [setting a Data Management Plan with the DMP Tool](#).

Version 2 of the DMP Tool Released

The University of Virginia Libraries' collaboration with several research institutions on the development of the DMP Tool, an online application that helps researchers create effective data management plans. Version 1 of the DMP Tool was released in November 2011, and with the help of a grant from the Alfred P. Sloan Foundation, we released version 2 on May 29, 2014.

Data management

Home Services Make a plan Store your data Share your data

Why manage & share your data?

Increase your research impact

Making your data available to other researchers can impact discovery and relevance of your research.

Save time

Planning ahead for your data management needs will save you time and resources.

Preserve your data

Depositing your data in a repository safeguards your investment of time and resources while preserving your research contribution for you and others to use.

Maintain data integrity

Managing and documenting your data throughout its life cycle will allow you and others to understand and use your data in the future.

Meet grant requirements

Many funding agencies now require that researchers deposit data collected as part of a research project.

Promote new discoveries

Sharing your data with other researchers can lead to new and unanticipated discoveries and provide research material for those with little or no funding.

Support open access

Be a catalyst for research and discovery. Show your support for open access by sharing your data. To learn more, check out the [Open Data movement](#).

THE UNIVERSITY OF EDINBURGH

Research Data Management

Why is data management important for your research?

Managing research data is becoming increasingly essential. Find out how you can benefit from managing your data, the policies you need to follow, and the UoE's student requirements on all related to data management.

Why is data management important?

EXAMPLE: PURDUE UNIVERSITY DIGITAL DANCE COMMONS (PurdueDDC)

1 Roles and responsibilities

Data management plan introduction:

Dance as an art-form is an inherently ephemeral, multi-faceted, and temporal-spatial form of expression that is difficult to recreate identically over time. Traditional methods of documentation such as notation, motion-capture, and film/video are unable to preserve all the components that construct a dance work. As such, dance scholars do not always have the reference materials they need for their research and dance heritage, traditions, and history are in danger of being lost. The Purdue University Digital Dance Commons (PurdueDDC) is a digital repository prototype for preserving the dance works of faculty and students in the Dance Department at Purdue University. The main intent is to identify key components essential to preserving dance works digitally for a specific audience.

This Data Management Plan addresses the curation of two kinds of data:

- Data sets generated from work performed during the course of project implementation. This includes documentation, survey results, and observations ABOUT the use and implementation of PurdueDDC
- Data sets consisting of dance works generated primarily content deposited by creators INTO PurdueDDC

The reason for having two types of expected data comes from fundamentally a development initiative supporting arts research by user needs.

Roles & Responsibilities:

Project Data Personnel

The following lists the project personnel who may generate some form of data and the actions or items that would result in a data set.

- Project Director: Documentation of project progress, system design, instructional materials.
- Information Technology Department: Bundling virtual images, software back-ups.
- Development Student Assistant: Documentation of system configuration, any customized code.
- Ingest Student Assistant: Documentation and feedback of the ingest process.

Dance Data Sets Personnel

The following lists the project personnel who may generate some form of data and the actions or items that would result in a data set.

- Dance Collaborators: Choreographic materials, documents about the choreographic work, any derived or related documents.
- Ingest Student Assistant: Digitized files of analog choreographic materials.

2 Expected data

Expected Data, Formats and Dissemination- Project Data:

The following lists the types of data that might be generated during each stage of the

Research Data Mgmt & Curation

“Hi, I know it’s short notice [*Friday, 9 am*] but I have to submit a data mgmt plan with my grant, and the deadline is this afternoon. Could you look this over and give me any advice?”

2. Expected data

The data generated by my research uses hospitality business (hotels and restaurants) data from the U.S. Census, hazard data from the Spatial Hazard Events and Losses Database (SHELDUS), socio-economic variables, and community vulnerability index and a hazard resilience index to form a computational database and website. It also functions as a natural hazard data collection repository and houses GIS-enabled community-specific vulnerability data. The website develops a framework for discerning natural disaster impacts on communities and their businesses so that adaptive decision making can occur.

3. Period of data retention

Data will be retained for at least three years beyond the award period, as required by NSF guidelines. In the event that discoveries are made in direct connection with this data, access will be granted upon request once appropriate disclosures are made. Key data relevant to the discovery will be preserved until timely publication and all issues of intellectual property are resolved.

4. Data formats and metadata

The data generated through the work described in this proposal will consist of the following data types: secondary data and sources such as County Business Pattern data, Spatial Hazard Events and Losses Database for the United States (SHELDUS), and various indexes (such as a social capital index); Primary data from focus groups, interviews, survey responses; Emergent data developed as a result of the project includes GIS-generated maps and a computational and collaborative website with GIS-enabled data.

Data Standards associated with the above data will conform to the following: secondary data will use NAICS, SPSS and / or Stata (statistical software) standards. Primary data will use interval scales; interview transcripts; qualitative data analyses (such as the qualitative Nvivo 10 software); Geospatial Data and Geospatial Technologies; Microsoft Word and Excel standard conventions; Network Authorization and Authentication Services, Portal, Schema, SSL, VPN, and Web Publishing, Web services, XML, and XQL standards for Website collaboration and usage.

The data to be acquired in the proposed project will include human subjects’ data that require Institutional Review Board approval. As detailed in the human subjects section of the proposal, all rules and regulations related to privacy (i.e., HIPPA) will be observed with specific regard to collected data.

5. Data dissemination and policies for public access, sharing and publication delays

Data generated from the project may be accessible by email request as well as a public, open-access policy on the website. Data will be accessible immediately after timely publication.

6. Data storage and preservation of access

Records of primary research results involving human subjects will be temporarily labeled and stored as digitized recordings and images. The de-identified electronic data will be preserved on external hard drives. Copies of these data will also be preserved offsite at Purdue University’s Research Repository (PURR). Completed questionnaires (as well as representative blank questionnaires) and human subject consent forms will be stored in a locked area of the PI’s laboratory accessible to the PI.

- Under #2. Expected data... One question to ask is _who will be likely to use this data?_ which relates to impact. Although you allude to it, you could explicitly identify likely users of data (you may already do this elsewhere).
- Under #5. Data dissemination (etc)... By using PURR you will be able to: publish the data, which assigns metadata for discovery and access, a Digital Object Identifier for persistence, and a standardized format for citation. The DOI is the big thing because published data are easier to track, especially the citations of your data by others. But you can embargo the data until the paper comes out.
- Under #6. Data storage and preservation... You might organize this section explicitly into two groups— that protected by IRB, and that which can be made publicly available—and state what happens to each.

ASSISTANCE WITH DATA

Researcher

- Nastasha Johnson:
Approaches in Science & Engineering

Research Data Mgmt & Curation

Sample Example: Chemistry

In single Chemistry Lab:

Experiments/Reactions →
Processes → Lab Habits →
Transferability → Naming
Conventions → Backups

Organic: (size?, formats)

- Publishable data??
(preservation, naming & file
conventions, metadata,
institutional repository, sharing)

Theoretical/Physical Chemistry:

Publishable data
(planning, managing, storing,
preservation, et. al)

Opportunities:

pre-award, award, post-award,
lab

Physics & Astronomy

- **national/international projects**
 - Dedicated data managers
 - Mediating between interdisciplinary and/or trans-disciplinary researchers
 - Standards developed in practice
 - **Opportunities:** few
- **institutional projects**
 - Lab-specific practices that may not translate outside of that particular lab
 - **Opportunities:** pre-award, award, post-award, lab

Earth Atmospheric & Planetary Sciences

- long history of longitudinal, systematic data curation and practices
- not reactive practices, but proactive practices
- **Opportunities:** few

Research Data Mgmt & Curation

Sample Example: (Biomedical) Engineering

- Every person for themselves!
- Very little to no consistent practices within the field
- Project or lab level only
- **Opportunities:** pre-award, award, post-award, lab

Research Data Mgmt & Curation

Sample Example: Pure Mathematics

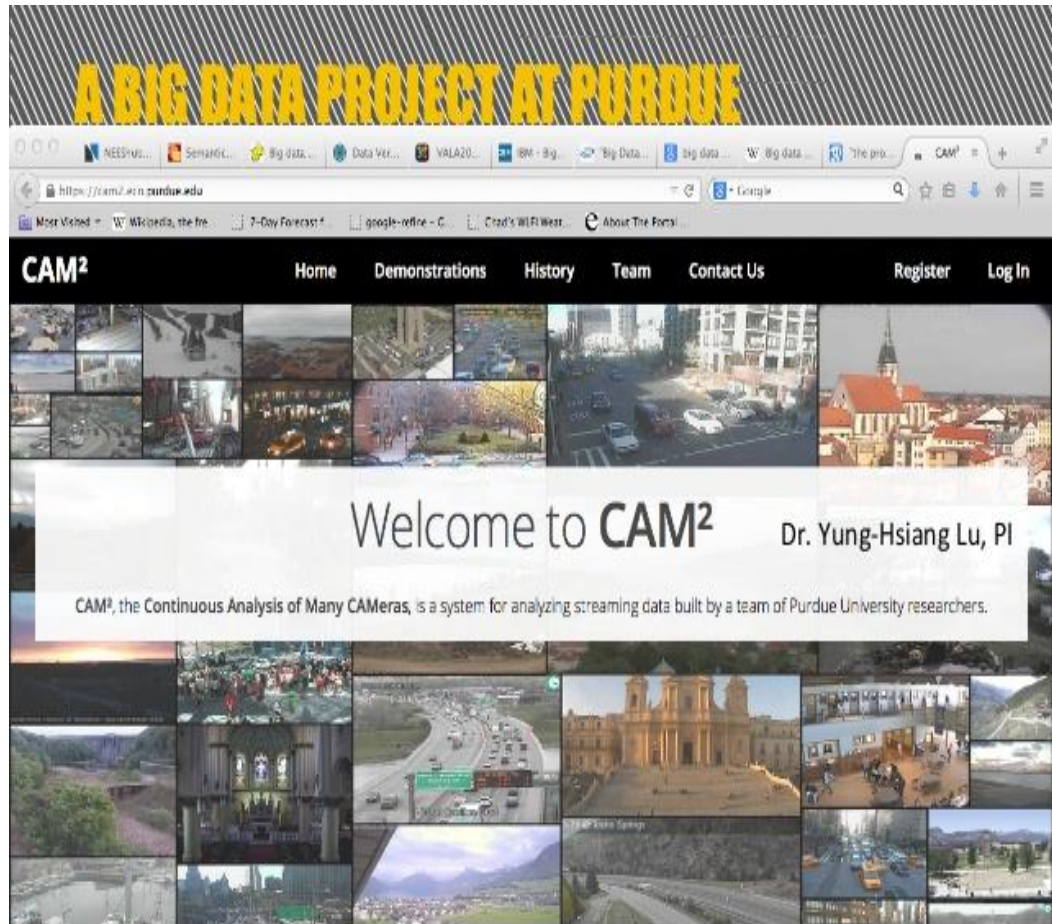

- **At first glance**
 - Individual sport but...
 - Contributes to the development and research of many other science disciplines
- **Opportunities**
 - Metadata
 - File formats
 - Naming conventions
 - pre-award, award, post-award, lab

Research Data Mgmt & Curation

Sample Example: Geographic Information Systems

- Varies by project
- “map and organize data so they can better understand relationships, patterns and trends”
 - Nicole Kong, GIS Specialist
- **Opportunities:** pre-award, award, post-award, lab, end-users

70000+ cameras all over the world, tons of images

Research Data Mgmt & Curation

Summary: Interdisciplinary, Transdisciplinary

- Conversations/Interviews
- One Size Does Not Fit All
- Mediating & Negotiating
- Standards developed in practice for projects and labs
- **Opportunities:** pre-award, award, post-award, project planning, anywhere and everywhere

Reference Interview Skills

Data curation profile toolkit

Ask in-depth or follow-up questions:

Current plans for storage?

Would you be willing to share your data? If so, at what stage?

What do you need to do to meet funder mandates? Is there a gap between current practice and how you would like to manage data?

Disciplinary information expertise...

...Disciplinary cultures of data practice

The response of the Contrarian Curmudgeon:

"You can have my data when you pry it out of my cold, dead hard drive"

Disciplinary cultures

Where are they in relationship to data sharing?

(ex. genomics vs. applied agriculture)

Do they routinely deal with sensitive data, such as human subjects or IP-rich research?

Are they interested in just better data management for better science/research vs. an interest in sharing?

Are they open to librarians assisting in developing standards or best practices?

Connect researchers to articles...

...connect researchers to data sets

Standards Pages

The PREMIS Data Dictionary for Preservation Metadata is the international standard for metadata to describe digital objects and ensure their long-term usability. Developed by an international team of experts, PREMIS is used by digital preservation projects around the world, and support for PREMIS is incorporated into a number of digital preservation tools and systems. The PREMIS Editorial Committee coordinates revisions and implementation. It consists of the Data Dictionary, an XML schema, and supporting documentation.
